

• Rubric 3: Review 3/VIVA (30 Marks) (PROJECT)

22/08/2026

Sr. No.	Evaluation Criteria	Excellent (5–6 Marks)	Good / Average (3–4 Marks)	Poor / Needs Improvement (0 to 2 Marks)
C1	Project Complexity & System Design (Group Assessment) (06 Marks)	The system architecture, database design, and tech stack selection are highly appropriate and well-engineered.	The project is functional but lacks technical depth or complexity. The architecture is basic but gets the job done.	The project is trivial, highly derivative, or incomplete. System design is fundamentally flawed.
C2	Individual Contribution & Implementation (Individual Assessment) (06 Marks)	The student clearly defines their specific role. They delivered complex, crucial features (e.g., built the core API, designed the ML model, or complex frontend logic) independently.	The student contributed to the project, but their tasks were relatively simple or heavily dependent on the other group members to complete.	The student "hitchhiked" on the group. They cannot clearly identify what they built, or their contribution was negligible.
C3	Teamwork, Integration & Tools (Group & Individual Assessment) (06 Marks)	Workload was distributed equitably among the 3 members. Excellent use of collaboration tools (Git branching/merging, Jira/Trello). The individual modules integrated seamlessly.	Workload was somewhat unbalanced. Used Git/tools basically, but integration was clunky or required last-minute manual fixing.	Poor team dynamics. Members worked in complete silos without collaboration tools, or one person did all the work. Integration failed.
C4	Achievement of Decided Objectives (Group Assessment) (06 Marks)	All objectives fully achieved with verifiable evidence: paper submitted/accepted, software live or submitted, or startup registered with measurable progress	Most objectives achieved; minor milestones pending or evidence partial	Objectives partially achieved; major deliverable incomplete
C5	A. Presentation & Domain Knowledge B. Q&A Handling & Technical Defense (Individual Assessment) (06 Marks)	The student's portion of the presentation is professional, concise, and structured. Demonstrates clear mastery over the domain and their specific modules. Answers questions confidently. Can explain their own code in detail and accurately explain how their code connects to their teammates' modules.	Presentation is adequate but relies heavily on reading slides. The student understands their part but lacks broader context. Can answer basic questions about their own code but stumbles on how it integrates with the rest of the system or deeper technical 'why' questions.	Presentation is unstructured, chaotic, or poorly articulated. Poor grasp of what the project actually does. Cannot defend their own code, explain the logic behind it, or answer fundamental questions about the technologies used.
